

## Sets

### Set Identities

Union:  $A \cup B : \{x \in \mathbb{S} : x \in A \text{ OR } x \in B\}$

Intersection:  $A \cap B : \{x \in \mathbb{S} : x \in A \text{ AND } x \in B\}$

Complement:  $A^c : \{x \in \mathbb{S} : x \notin A\}$

Difference:  $A - B : \{x \in \mathbb{S} : x \in A, x \notin B\}$

Infinite Union:  $\bigcup_{i=1}^{\infty} A_i : \{x \in \mathbb{S}, x \in A_i \ni A_i\}$

Infinite Intersection:  $\bigcap_{i=1}^{\infty} A_i : \{x \in \mathbb{S}, x \in A_i \forall A_i\}$

### Set Relationships

Containment:  $A \subseteq B$  ( $A$  is a subset of  $B$ ):  $x \in A$  means  $x \in B$

Equality: Two sets are equal if they contain each other:  $A = B \therefore A \subseteq B, B \subseteq A$

Disjoint:  $A \cap B = \{\}$

### Set Properties

Commutativity:  $A \cup B = B \cup A, A \cap B = B \cap A$

Associativity:  $A \cup (B \cup C) = (A \cup B) \cup C, A \cap (B \cap C) = (A \cap B) \cap C$

Distributive:  $A \cap (B \cup C) = (A \cap B) \cup (A \cap C), A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$

DeMorgan's Law:  $(A \cup B)^c = A^c \cap B^c, (A \cap B)^c = A^c \cup B^c$

## Sigma Algebras

### Identity

A collection of subsets of  $S$  is a  $\sigma$ -algebra ( $\mathbb{B}$ ) iff:

a.  $\emptyset \in \mathbb{B}$

b.  $A \in \mathbb{B} \implies A^c \in \mathbb{B}$

c.  $A_1, A_2, \dots \in \mathbb{B} \implies \bigcup_{n=1}^{\infty} A_n \in \mathbb{B}$

### Construction

$S$  is finite/countable:  $\mathbb{B} = \mathbb{P}(\mathbb{S})$  (Power Set of  $\mathbb{S}$ , all possible subsets of  $\mathbb{S}$ )

$S$  is infinite/uncountable: Use Borel sets:  $\mathbb{B} = \{(a, b), [a, b), [a, b]\}$  for  $a < b$  and all countable  $\cup$  and  $\cap$  of those

## Probability Functions

### Axioms

Given  $\mathbb{S}$  and  $\sigma$ -algebra, a probability function with domain  $\mathbb{B}$  satisfies:

a.  $P(A) \geq 0$  for all  $A \in \mathbb{B}$

b.  $P(\mathbb{S}) = 1$

c. If  $A_1, A_2, \dots$  are pairwise disjoint, then  $P(\bigcup_{n=1}^{\infty} A_n) = \sum_{n=1}^{\infty} P(A_n)$

### Properties

1)  $P(\emptyset) = 0$

2)  $A \subseteq \mathbb{S} \implies P(A) \leq 1$

3)  $P(A^c) = 1 - P(A)$

4)  $P(B \cap A^c) = P(B) - P(A \cap B)$

5)  $P(A \cup B) = P(A) + P(B) - P(A \cap B)$

6)  $A \subseteq B \implies P(A) \leq P(B)$

7) Let  $c_1, c_2, \dots$  be a partition of  $\mathbb{S}$  (ie.  $c_i \cap c_j = \emptyset$  for  $i \neq j$ ,  $\bigcup_{i=1}^{\infty} c_i = \mathbb{S}$ )

-  $P(A) = \sum_{i=1}^{\infty} P(A \cap c_i)$

8) For any  $A_1, A_2, \dots$ ;  $P(\bigcup_{i=1}^{\infty} A_i) \leq \sum_{i=1}^{\infty} P(A_i)$

## Counting

### Sampling

	w/o Repl.	w/ Repl.
Ordered Perm.	$\frac{n!}{(n-1)!}$	$n^r$
Unordered Comb.	$\frac{n!}{(n-r)!r!} : \binom{n}{r}$	$\binom{n+r-1}{r}$

### Axioms

Enumerating equally likely outcomes (assume large but finite  $\mathbb{S}$ ,  $|\mathbb{S}| = N$ ). Want  $P(A)$  where  $A \subset \mathbb{S}$ ,  $A \in \mathbb{B}$

-  $P(A) = \frac{\# \text{ things in } A}{N}$

Product Rule:

- If a job consists of  $k$  separate experiments, the  $i^{th}$  of which can be done in  $n_i$  ways, then the job can be done in  $n_1 * n_2 * \dots * n_k$  ways

Sum Rule:

- If there are  $k$  events, the  $i^{th}$  of which can occur in  $n_i$  ways, then there are  $n_1 + n_2 + \dots + n_k$  to complete exactly 1 event

Inclusion/Exclusion: want to enumerate elements in  $A$  :  $N_A = |A|$ , sometimes easier to find:

-  $N_{A^c} = |A^c| \therefore N_A = N - N_{A^c}$

### Continuous

Consider  $\mathbb{S} \subset \mathbb{R}^d$  with uniform probability

Then for  $A \subseteq \mathbb{S}, P(A) = \frac{\int_A ds}{\int_{\mathbb{S}} ds}$

## Conditional Probability

If  $A, B \subseteq \mathbb{S}$  and  $P(B) > 0$ ;  
 $P(A|B) = \frac{P(A \cap B)}{P(B)} = \frac{P(B|A)P(A)}{P(B)}$

Often use the law of total probability ( $c_i \cap c_j = \emptyset$  for  $i \neq j$ ,  $\bigcup_{i=1}^{\infty} c_i = \mathbb{S}$ ):

$$P(B) = \sum_{i=1}^n P(B|c_i)P(c_i)$$

## Independence

$A \perp B$  iff  $P(A|B) = P(A)$

$A \perp B \implies A \perp B^c, A^c \perp B, A^c \perp B^c$

Mutual Independence:

A collection of events  $A_1, \dots, A_n$  are mut. ind. if, for any subcollection of  $A_{i_1}, \dots, A_{i_k}$  we have:

$$- P\left(\bigcap_{j=1}^k A_{i_j}\right) = \prod_{j=1}^k P(A_{i_j})$$

## Conditional Independence

$A$  and  $B$  are conditionally independent given  $C$  if:

$$P([A \cap B]|C) = P(A|C)P(B|C)$$

## Random Variables

### Definition

A random variable (vector) is a function that maps from the sample space  $\mathbb{S}$  to the real numbers  $\mathbb{R}$

Formally:  $X : \mathbb{S} \Rightarrow \mathbb{R}, \tilde{X} : \mathbb{S} \Rightarrow \mathbb{R}$

### Cumulative Distribution Function

The CDF of a random variable ( $F_X(x)$ ) is defined as:  $P(X \leq x)$  for all  $x \in \mathbb{R}$

- $\lim_{x \rightarrow -\infty} F_X(x) = 0, \lim_{x \rightarrow \infty} F_X(x) = 1$
- $F_X(x)$  is non-decreasing ie. for  $x_i \leq x_2, F(x_1) \leq F(x_2)$
- $F_X(x)$  is right-continuous ie.  $\lim_{x \downarrow x_0} F_X(x) = F_X(x_0)$

### Probability Density/Mass Function

A PMF is given by  $f_X(x) = P(X = x)$

A PDF of a continuous random variable satisfies the following:

$$- \int_{-\infty}^x f_X(t) dt \text{ for all } x \therefore f(X) = \frac{dF_X}{dx}$$

$$- P(a \leq x \leq b) = \int_a^b f_X(x) dx = P(a < x < b) = F(b) - F(a)$$

A function is a valid PMF/PDF iff:

- $f_X(x) \geq 0, \forall x$
- $\sum_{x \in X} f_X(x) = 1$  -OR-  $\int_x f_X(x) dx = 1$

## Kernel

Any non-negative function with a finite integral or sum can be made into a PDF or PMF

- $h(x) \geq 0 \forall x$
- $\int_{x \in X} h(x) dx = k, 0 < k < \infty$
- $f_X(x) = \frac{1}{k} h(x) I_X(x)$

## Common PDFs

Besides those given in the book:

- Survival Function:  $S_X(x) = P(X > x) = 1 - F_X(x)$
- Hazard Function:  $H_X(x) = \frac{f_X(x)}{S_X(x)}$
- Gamma Function:  $\Gamma(\alpha) = \int_0^{\infty} t^{\alpha-1} e^{-t} dt$
- - If  $\alpha$  is an integer:  $\Gamma(\alpha) = (\alpha - 1)!$
- - For general  $\alpha$ :  $\Gamma(\alpha + 1) = \alpha \Gamma(\alpha)$
- - Also:  $\Gamma(\frac{1}{2}) = \sqrt{\pi}$

## Expected Value

### Definition

Given a random variable  $g(x)$ :

$$\mathbb{E}[g(x)] = \begin{cases} \int_{-\infty}^{\infty} g(x) f_X(x) dx, & \text{Continuous} \\ \sum_{x \in X} g(x) f_X(x), & \text{Discrete} \end{cases}$$

Law of Unconscious Statistician: Let  $Y = g(x)$

$$- \mathbb{E}[g(x)] = \int_{-\infty}^{\infty} g(x) f_X(x) dx = \int_{-\infty}^{\infty} Y f_Y(y) dy = \mathbb{E}[Y]$$

Probability as an Expectation:

$$P(x \in A) = \int_A f_X(x) dx = \int_{-\infty}^{\infty} I_A(x) f_X(x) dx = \mathbb{E}[I_A(x)]$$

### Properties of Expected Values

- $\mathbb{E}[ax + b] = a \mathbb{E}[x] + b, \mathbb{E}[ag_1(x) + bg_2(x)] = a \mathbb{E}[g_1(x)] + b \mathbb{E}[g_2(x)]$
- If  $g(x) \geq 0, \forall x \in X$ , then  $\mathbb{E}[g(x)] \geq 0$
- If  $g_1(x) \geq g_2(x), \forall x \in X$ , then  $\mathbb{E}[g_1(x)] \geq \mathbb{E}[g_2(x)]$
- If  $a \leq g(x) \leq b, \forall x \in X$ , then  $a \leq \mathbb{E}[g(x)] \leq b$

## Moments

### Definition

For each interger  $n$ , the  $n^{th}$  moment of  $X$  is  $\mathbb{E}[X^n]$

The  $n^{th}$  central moment is:  $\mathbb{E}[X - \mathbb{E}[X]]^n$

Expected value is the first moment, Variance is the second central moment

Properties of Variance:

- $Var(aX + b) = a^2 Var(X)$
- $Var(X) = \mathbb{E}[X^2] - (\mathbb{E}[X])^2$

## Jensen's Inequality

Want to compare  $\mathbb{E}[X]$  vs.  $\mathbb{E}[Y]$  where  $Y = g(X)$ . Often can't directly compare.

$$JE : \begin{cases} \mathbb{E}[g(X)] \geq g(\mathbb{E}[X]), & g(x) \text{ is convex} \\ \mathbb{E}[g(X)] \leq g(\mathbb{E}[X]), & g(x) \text{ is concave} \end{cases}$$

How to tell if  $g(x)$  is convex:

- Draw it (convex is bowl-shaped)
- Second Derivative:  $g''(x) > 0 \implies \text{convex}$

## Moment Generating Function (MGF)

$$M_X(t) = \mathbb{E}[e^{tx}] = \begin{cases} \int_{-\infty}^{\infty} e^{tx} f_X(x) dx, & X \text{ is continuous} \\ \sum_{x \in X} e^{tx} f_X(x), & X \text{ is discrete} \end{cases}$$

This holds if the expectation exists for  $t$  in the neighborhood of 0. That is, there exists an  $h > 0$  such that  $\mathbb{E}(e^{tx})$  exists for all  $-h < t < h$

$$\mathbb{E}[X^n] = M_X^{(n)}(0) = \frac{d^n}{dt^n} M_X(t) \big|_{t=0}$$

## Characterizing Distributions

- If  $X$  and  $Y$  have bounded support,  $F_X(u) = F_Y(u)$  for all  $u$  iff  $\mathbb{E}[X^r] = \mathbb{E}[Y^r]$ ,  $r = 0, 1, 2, 3, \dots$  (all moments are equal)
- If MGF exists  $M_X(t) = M_Y(t)$  for some  $t$  in neighborhood of 0, then  $F_X(u) = F_Y(u)$  for all  $u$

A sequence of random variables,  $X_i, i = 1, 2, 3, \dots$  each with an MGF  $M_{X_i}(t)$ . Further suppose  $\lim_{i \rightarrow \infty} M_{X_i}(t) = M_x(t)$  for  $t$  in neighborhood of 0, and  $M_x(t)$  is also an MGF

Then: there is a unique CDF  $F_X(x)$  whose moments are determined by  $M_x(t)$  and  $\lim_{i \rightarrow \infty} F_{X_i}(x) = F_x(x)$

Basically, if the MGFs of RVs converge to an MGF, then the RVs themselves converge to the RV of the converged MGF

Lemma: Let  $a_1, a_2, a_3, \dots$  be a sequence of numbers such that  $\lim_{n \rightarrow \infty} a_n = a$

Then:  $\lim_{n \rightarrow \infty} (1 + \frac{a_n}{n})^n = e^a$

Theorem: Let  $Y = aX + b$ .  $\therefore M_Y(t) = e^{at} M_X(t)$

## Transformations

### Definition

$X$  is a random variable, then  $Y = g(X)$  is also a random variable. To find  $P(Y)$  we need either  $F_Y(y)$  or  $f_Y(y)$

- $g(X)$  maps from  $\mathbb{X}$  to  $\mathbb{Y}$ , basically  $\mathbb{S} \rightarrow \mathbb{X} \rightarrow \mathbb{Y}$
- $\forall A, P(Y \in A) = P(g(X) \in A) = P(\{x \in \mathbb{X} : g(x) \in A\}) = P(X \in g^{-1}(A))$

### Discrete

$$f_Y(y) = \begin{cases} \sum_{x \in g^{-1}(y)} P(X = x), & Y \in \mathbb{Y} \\ 0, & \text{otherwise} \end{cases}$$

Steps:

- 1) Find  $\mathbb{Y}$
- 2) Identify  $g^{-1}(y)$
- 3) Sum over appropriate  $x$  (if  $g^{-1}(y)$  is a set with one element,  $f_Y(y) = f_X(g^{-1}(y))$ )

### Continuous

$$F_Y(y) = P(Y = y) = P(g(x) \leq y) = \int_{x \in \mathbb{X}: g(x) \leq y} f_X(x) dx$$

If  $Y = g(X)$  is monotone,  $g^{-1}$  exists. If it's increasing, the inverse is as well (vice versa for decreasing)

If  $g(X)$  is increasing,  $F_Y(y) = F_X(g^{-1}(y))$ . If  $g(X)$  is decreasing,  $F_Y(y) = 1 - F_X(g^{-1}(y))$ . In both:

$$f_Y(y) = \begin{cases} f_X(g^{-1}(y)) \left| \frac{d}{dy} g^{-1}(y) \right|, & y \in \mathbb{Y} \\ 0, & \text{otherwise} \end{cases}$$

Steps:

- 1) Find  $\mathbb{Y}$
- 2) Find  $g^{-1}(y)$
- 3) Find  $\frac{d}{dy} g^{-1}(y)$
- 4) Plug into  $f_X(g^{-1}(y)) \left| \frac{d}{dy} g^{-1}(y) \right|$

If the transformation is non-monotonic, all you need to do is find the points of inflection and partition the transformation within each region of monotonicity

## Probability Integral Transform

NOT SURE IF REALLY NEED (7 Oct 2025)

## Location Scale Family

Let  $f_X(x)$  be a PDF and  $\mu \in \mathbb{R}, \sigma > 0$ , then

$$g(x) = \frac{1}{\sigma} f_X\left(\frac{x - \mu}{\sigma}\right)$$

This is the case when there exists a  $Z$  such that  $X = \mu + \sigma Z$

## MonteCarlo Integration

Write an integral as an expectation:

$$I = \int_a^b h(x)dx = \int_a^b \frac{h(x)}{f_X(x)} f_X(x)dx = \mathbb{E}\left[\frac{h(x)}{f_X(x)} I_{(a,b)}(x)\right]$$

Steps:

- 1) Simulate  $x_1, \dots, x_n$  from  $f_X(x)$
  - 2) Calculate  $g(x_j) = \frac{h(x_j)}{f_X(x_j)} I_{(a,b)}^{(x_j)}, \forall j$
  - 3)  $\mathbb{E}[g(x)] \approx \frac{1}{n} \sum_{j=1}^n g(x_j) \equiv \bar{g}$
- $$SE(\bar{g}_n) \approx \frac{1}{\sqrt{n}} s.d.(g(x_1), \dots, g(x_n))$$

## Importance Sampling

FILL IN STUFF

### Oct 30

Ex:  $X|Z \sim N(Z, \sigma^2), Y|Z \sim N(Z, \sigma^2), (X \perp Y)|Z$

We can say:  $X = Z + \epsilon_X, Y = Z + \epsilon_Y : \epsilon_X, \epsilon_Y \sim N(0, \sigma^2), Z \sim N(\mu, \tau^2)$

$$Cov(X, Y) = Cov(Z + \epsilon_X, Z + \epsilon_Y) = Cov(Z, Z) = Var(Z) = \tau^2$$

For the correlation we need:

$$Var(Y) = Var(Z) + Var(\epsilon_Y) = \tau^2 + \sigma^2$$

$$Var(X) = Var(Z) + Var(\epsilon_X) = \tau^2 + \sigma^2$$

$$Corr(X, Y) = \frac{Cov(X, Y)}{\sqrt{Var(X)}\sqrt{Var(Y)}} = \frac{\tau^2}{\tau^2 + \sigma^2}$$

## Law of Total Covariance

For random variables  $X, Y, Z$ , with hierarchy as  $(X|Y, Z), (Y|Z)$ , and  $Z$ ;

$$Cov(X, Y) = \mathbb{E}[Cov(X, Y|Z)] + Cov(\mathbb{E}[X|Z], \mathbb{E}[Y|Z])$$

## Random Samples and Sums of Random Variables

### Definition

The random variables  $X_1, \dots, X_n$  are a random sample of size  $n$  from population  $f_X(x)$  if  $X_i \stackrel{iid}{\sim} f_X(\cdot), i = 1, \dots, n$

### Joint PDF/PMF

$X_1, \dots, X_n$  is a random sample. Since they are *iid*,

$$f(x_1, \dots, x_n) = \prod_{i=1}^n f_X(x_i)$$

Ex. Let  $X_1, \dots, X_n$  be the failure times in years of the  $i^{th}$  identical circuit components.

Assume  $X_i \stackrel{iid}{\sim} Exp(\beta)$

$$\text{Thus: } f(x_1, \dots, x_n) = \prod_{i=1}^n \frac{1}{\beta} e^{-x_i/\beta} = \frac{1}{\beta^n} e^{-\frac{1}{\beta} \sum X_i}$$

Use this to find:

$$P(X_1 > 2, X_2 > 2, \dots, X_n > 2) = [P(X_1 > 2)]^n = [1 - P(X_1 < 2)]^n = [1 - 1 + e^{-\frac{2}{\beta}}]^n = e^{-\frac{2n}{\beta}}$$

Definition: Sampling Distribution - Let  $X_1, \dots, X_n$  be a random sample of size  $n$ . Let  $T(X_1, \dots, X_n)$  be a real-valued, real-vector function whose domain includes  $\mathbb{X}$ .

Then  $T(X_1, \dots, X_n)$  is a statistic and its distribution is a sampling distribution.

Common Statistics

$$\bar{X} = \frac{1}{n} \sum_{i=1}^n X_i$$

$$s^2 = \frac{1}{n-1} \sum_{i=1}^n (X_i - \bar{X})^2$$

Order statistics: media, range, etc.

Theorem: Let  $x_1, \dots, x_n$  be any numbers and  $\bar{x} = \frac{1}{n} \sum_{i=1}^n x_i$

then:

$$\text{a. } \min_a \sum_{i=1}^n (x_i - a)^2 = \sum_{i=1}^n (x_i - \bar{x})^2 \text{ -or- } \bar{x} =$$

$$\operatorname{argmin}_a \sum_{i=1}^n (x_i - a)^2$$

$$\text{b. } (n-1)s^2 = \sum_{i=1}^n (x_i - \bar{x})^2 = \sum_{i=1}^n x_i^2 - n\bar{x}^2$$

Theorem: Let  $Z_1, \dots, Z_n$  be a random sample with population mean and variance  $\mu, \sigma^2$ , then:

- 1)  $\mathbb{E}(\bar{X}) = \mu$
- 2)  $Var(\bar{X}) = \frac{\sigma^2}{n}$
- 3)  $\mathbb{E}(s^2) = \sigma^2$
